

**I used a calculated column (math + science + english) to get total score.**

**The query orders students by total score and uses OFFSET–FETCH to return the top 5.**

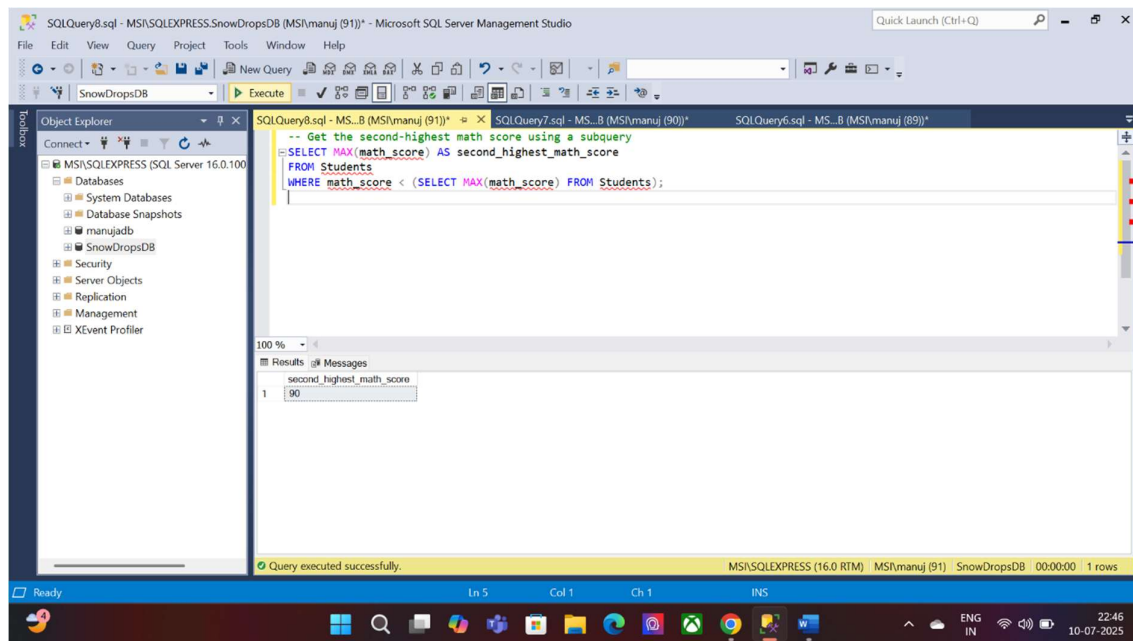

**The first query filters students who scored more than 70 in Math and returns their average.**

**The second query filters students with total scores between 200 and 250 and averages that group.**

**A subquery gets the highest math score.  
Then we find the highest score that's less than that, giving us the  
second highest.**

- Top 5 students are ranked by total score.
- Average math score for high performers ( $>70$ ) calculated.
- Second highest Math score found using subquery logic.
